

Health Notes

SCLEROLOGY CHART

Sclerology is the study of the red lines in the white parts of the eye. There are signs, markings, shapes, and colours that allow professionals to determine the current state of health.

Just as Iridology, this study allows us to see signs before symptoms arise, even before blood tests.

When looking into the eye one may see blood vessels, when these blood vessels point to certain organ reflex in the iris, it can indicate there is something wrong with that organ.

Benefits of Sclerology

Sclerology provides an early warning - an earlier warning than any other eye-sciences - and so allows a person the time to correct before a condition becomes chronic.

The lines in the sclera change as health conditions change. Therefore Sclerology is an excellent way to confirm that a therapy is working.

The sclera's patterns reveal the weak links in a person's constitution. This knowledge can provide vital preventative measures.

TYPES OF SCLERA MARKINGS
